

The Revitalight Skincare System is a safe, but effective use of advanced light technology designed to help diminish the visible appearance of fine lines, wrinkles, and age spots on the face, neck, and hands by promoting collagen firmness.

The Revitalight Skincare System uses photopulsation technology allowing people to have an effective and safe, non-invasive cosmetic skin care application in the comfort and convenience of a salon or spa. Extensive research involving safe light sources and wavelengths has enabled the Revitalight Team to create applications that allow light emitting diodes, LEDs, to help alleviate signs of aging. The LED wavelengths are less than half the strength of lasers used at their lowest levels by dermatologists, and therefore are completely harmless, yet effective.

The LED succeeds by passing its light through the skin in order to help promote collagen firmness. The skin naturally appears smoother, tighter, and more radiant as the collagen becomes more firm. The Revitalight System's cool temperatures cannot harm the skin in any way, and the disposable pulsator covers, made of FDA-approved plastic, assure that only a sanitized device touches the client's skin.

How exactly does LED (Light Emitting Diode) therapy work?

LED uses pulses of visible therapeutic light over many wavelengths that deliver energy to all layers of the skin. LED treatments, work on the principal that light is absorbed by color and that light generates heat. It is being used in the NASA space program to aid in the rapid healing of cuts, scrapes, and bruises.

Why are cosmetologists and Aestheticians using LED therapy?

Most, if not all cosmetology boards, have issued opinions that, because LED treatments are both non-invasive and non-ablative, they require no special licensing, thus they are approved for their use.

Will LED therapy work on all types of people?

There isn't any machine, system or application that will work on everyone, however, it is estimated that LED will work on over 90% of the population. For those looking for a non-invasive, minimal risk solution without any down time, it is ideal.

Is there any discomfort during or after the treatment?

No, as a matter of fact, during the treatment you can use the massager in the large pulsator, which is very relaxing. There is no recovery time after the treatment. LED Pulse Light application leaves no after effects whatsoever. You can carry on with all your normal activities.

Is it safe?

Absolutely. The LED light uses less energy than a night light. Revitalight's cool temperatures cannot harm the skin in any way, and the disposable plastic pulsator cover assures that only a sanitized pulsator touches the skin.

How effective are the treatments?

The skin will appear smoother, tighter, and more radiant, showing continued improvement in appearance with each subsequent treatment.

How soon will I see the results?

Most people will see results after the first application. All people will feel the results of a softer, smoother skin that is more hydrated and has a "glamorous glow". We recommend an average of 6 applications for maximum results.

How long does a treatment take?

Each treatment takes approximately 10 – 12 minutes, depending on the condition of the skin. (Acne is a 20-minute treatment)

How many treatments are necessary and how often?

Though skin types vary, 6 treatments are generally needed for the desired results, with a maintenance treatment every one or two months. We suggest 7 – 14 days intervals between applications. Overuse is counter productive.

Do I need to remove make-up before a treatment?

Yes, the LED lights won't penetrate the skin as well if the client has make-up on. A client should have a clean face, neck, and body.
